Testing to Prevent Colon Cancer 500

A rural PBRN reports the results of an innovative community-partnered intervention to increase screening for colorectal cancer.

Patients' Perceptions of Care Quality 508

Most patients perceive high quality of care in federally supported health centers; access to care and communication are associated with greater likelihood of such reports.

Patients' Experiences in Chinese Health Centers 517

In China, government-owned and -managed community health centers may provide better utilization and coordination of care compared with other ownership and management models.

Impact of What We Say to Patients 557

Health care professionals have a powerful and enduring influence on the attitudes and beliefs of people with low back pain.

Multimorbidity in Australian Primary Care 535

Multimorbidity is a significant problem across all age-groups, with a moderate severity index increasing with age.

Trust in Practice-Based Research 543

The Work Relationships Scale shows promising validity in assessing the quality of staff and clinician relationships in primary care settings.

Quality of Staff and Clinician Relationships 550

Trust is critically important in recruiting and retaining underrepresented communities to participate in practice-based research.

Number Needed to Benefit from Information 559

A new concept for assessing the usefulness of medical information may help clinicians find electronic knowledge resources most likely to help patients.

Community Intervention to Prevent Colon Cancer 568

Community members describe their collaboration with primary care practices and academic researchers in a regional cancer-screening program.

Rediscovering Community 571

A pharmacist provides emergency services and discovers the meaning of community in the wake of Hurricane Sandy.

Six Habits for Patient Encounters 574

More than medical perfection, cure, or relief, patients want a connection with their doctor.
