

## In this issue of the *Annals of Family Medicine*

### Collaborative Care Model for Depression 412

*A carefully designed effectiveness trial of the collaborative care model fails to demonstrate improved outcomes for depression.*

### Voluntarily Stopping of Eating and Drinking 421

*Almost one-half of Dutch family physicians have experienced patients hastening death by voluntary stopping of eating and drinking.*

### The Cost of Sustaining a PCMH 429

*This study estimates costs of PCMH services based on types of personnel, time spent, and actual compensation.*

### HIV Experience and Care Delivery in Ontario 436

*HIV patients are more likely to receive ART therapy from family physicians who care for larger numbers of HIV patients.*

### Multimorbidity in India 446

*In a primary care sample from India, age, female sex, higher socioeconomic status, and care from a private facility are associated with multimorbidity.*

### Typology of the Complex Patient 451

*Primary care clinicians see patient complexity as a multi-dimensional concept with a range of factors that exacerbate chronic illness.*

### A Participatory Model of the Primary Care Paradox 456

*A group participatory approach to developing an agent-based model aims to explain the primary care paradox.*

### Managing Heart Failure Patients 466

*Heart failure nurses can deliver tailored patient education and facilitate communication in a multidisciplinary team.*

### No-Fault Injury Claims to Improve Safety 472

*In New Zealand's no-fault injury claims system, medical injuries are most often caused by medications.*

### Challenges in Practice-Based Research 475

*Novel strategies from a national PBRN study can help address challenges in network research.*

### Cancer Risk Assessment 480

*Cancer risk-assessment tools may increase patient intentions to get screened but not screening behavior.*

### I'm a Doctor. Can I Help? 490

*On a quiet California highway a young physician finds his passion for healing.*
