

In this issue of the *Annals of Family Medicine*

Practice Facilitation to Improve Diabetes Care 8

Traditional continuous quality improvement interventions are effective at improving diabetes quality measures, but may not improve practice change and work culture.

AAFP Diabetes PIP Module Improvement Outcomes 17

Analysis of the American Board of Family Medicine Maintenance of Certification diabetes quality improvement data from 8,000 family physicians shows improvement in patient care from this process.

Targeted Melanoma Prevention Intervention 21

A targeted screening and education intervention is more effective than conventional information for improving melanoma prevention behavior and skin self-examination in high-risk family medicine patients.

Managing Antibiotics Expectations for URTIs 29

When treating upper respiratory tract infections, family physicians prefer to elicit patients' expectations for antibiotics indirectly.

Engagement and Buy-in to PCMH 37

Strategies to facilitate practice change highlight the importance of effective communication, appropriate resource utilization, and a team environment.

Measuring Capability for Healthy Behavior 46

Practical opportunities for healthy behavior can be measured as a primary target for clinical and public health assessment and intervention.

Self-Rated Health and Depression Prognosis 57

A single-item general health status question identifies patients at risk of persistent major depression up to 5 years later.

Systems and Complexity Thinking 66

A historical review tracks evolving conceptual linkages between family medicine and complexity science.

Generation III on Keystone III 75

In this report, written in 2000, a group of young physicians reflect on their place in family medicine's past and present, and share a vision of the future.
