

## In this issue of the *Annals of Family Medicine*

### Concordant and Discordant Conditions 514

*A concordant/discordant model does not fully explain the association between practice-level diabetes care quality and prevalence of other chronic conditions.*

### Care Integration and Chronic Disease 523

*People with chronic disease and frequent users of health care services experience improved access, communication, coordination, and involvement in decision making in a care management intervention.*

### Management of Pediatric Upper Respiratory Tract Infections 529

*This study does not identify any community factors that are related to inappropriate prescription of antibiotics for URI.*

### The Identity Crisis of Osteoarthritis in General Practice 537

*Common communication issues are seen in complex visits involving osteoarthritis.*

### Effectiveness of Intervention for Inappropriate Prescribing 545

*A multi-faceted physician-based intervention reduced potentially inappropriate prescribing in the primary care setting.*

### Integrating Quantitative and Qualitative Results 554

*In mixed methods research, joint displays of qualitative and quantitative data can facilitate integrated analyses and new insights.*

### Transitional Care for Patients With Congestive Heart Failure 562

*Transitional care interventions for CHF patients reduce readmissions and emergency department visits.*

### Mindfulness-Based Interventions in Primary Care 573

*Mindfulness-based interventions may improve mental health and quality of life in family medicine and primary care patients.*

### Obstructive Sleep Apnea in a Train Engineer 583

*A tragic train derailment serves as a strong reminder to assess for sleep apnea in patients with high risk jobs.*

### The Untaught Lesson 587

*When a friend refuses to accept a terminal diagnosis, a family physician searches for meaning in the unknown.*
