Chronic Opioid Prescribing in Primary Care 200

Clinicians report barriers to deprescribing chronic opioids, in spite of the higher risk of medication-associated harms.

Opioid Use Disorder and Treatment for Parents Living With Children 207

More than a half million parents with opioid use disorder and 4 million parents with other substance use disorders are living with children, yet treatment and counseling rates are low.

Buprenorphine Physicians and Location of Practice 212

Buprenorphine clinicians in rural areas are more likely than their urban counterparts to be primary care clinicians, but treatment practices and quality are similar.

A New Comprehensive Measure of High-Value Aspects of Primary Care 221

A new patient-rated measure of the personalizing and integrative functions of primary care has breadth, brevity, and internal consistency.

Predictors of Adverse Outcomes in Lower Respiratory Tract Infections 231

Serious outcomes rarely occur in patients with lower respiratory tract infection but may be predicted with moderate accuracy.

Primary Care Attendance Intentions for Pediatric Respiratory Tract Infections 239

An online intervention with symptom advice and real-time data on local respiratory tract infections reduced parent intentions to attend primary care.

Shifting Implementation Science Theory to Empower Primary Care Practices 250

A new theory of dissemination and implementation shifts the source and direction of practice change.

Potentially Inappropriate Prescribing Among Older Persons in Primary Care 257

In older adults, inappropriate prescribing is associated with a wide range of adverse outcomes, but not mortality.

Health Care and Longevity: A Review of Four Estimation Methods 267

Restricted access to medical care accounts for about 10% of premature death or other undesirable health outcomes.
