**Abstract**

*Context:* Primary care providers are on the front line of the opioid crisis attempting to appropriately prescribe opioids and provide compassionate care. Providers are in a difficult position and often need the counsel from those in pain management, addiction medicine and medication tapering. This has led to the development of a multidisciplinary Controlled Substance Advisory Group (CSAG) in 2016 at our institution comprising 9 members: 5 from primary care (2 clinicians, 1 pharmacist, 2 nurses); 1 pain specialist; 1 psychiatrist; and 2 pain rehabilitation providers (1 psychologist, 1 pharmacist). Having an outside group review cases and provide recommendations allows providers to preserve their relationship with patients. 

**Objectives:** (1) To assess the characteristics of a sample of cases reviewed by CSAG from January 2019 to March 2021 (2) To evaluate the perceived usefulness of the case review process. 

**Study Design:** Retrospective review of referred cases. Surveys were sent to referring providers after the review. 

**Setting:** Primary care clinics within Mayo Clinic and Mayo Clinic Health Systems in Minnesota. 

**Population:** Patients on controlled substances not in hospice and without an active cancer diagnosis. 

**Intervention:** Referring providers are invited to a real-time case review. Recommendations are entered into patients’ health records. 

**Outcomes:** Cases reviewed categorized into referral sources, types of controlled substance of concern, and review recommendations; feedback from referring providers. 

**Results:** A sample of 72 cases from January 2019 to March 2021 were analyzed: 41% referrals came from physicians, 13% from advanced practice providers, 46% from practice leadership. 94% cases included opioids. Recommendations for 78% of cases included discontinuation/tapering; in the remaining 22%, CSAG recommended starting, restarting, or continuing a controlled substance. CSAG provided recommendations regarding non-controlled adjuncts in 39% of cases. In 32% of cases, CSAG recommended naloxone. 85% referring providers were able to implement most of the recommendations, 79% reported that the review was helpful in preserving provider-patient relationship, 95% would refer cases again and would recommend...
CSAG to colleagues. Conclusions: CSAG allows providers to have easier access to specialists while preserving relationship with patients.
